**Keywords:** cognition; cognitics, modeling, Piaget, real-time intelligent control

18/11/2014 J.-D. Dessimoz, HESSO.HEIG-VD, SGAICO, Basel 2

# 1. Introduction

---

- **In general terms, cognition has made the condition of humans very attractive and successful, in comparison to other elements of nature as we know it [1].**
- **Progress in sciences, engineering, and especially ICT's, now allows to address with good chances of success automated applications relating to cognitive issues (for AI aspects, re. e.g. [2]).**
- **Five theses about cognition have recently been delineated [3] , which can be seen both as paths towards better insights in human and social nature and also as a roadmap for simultaneous and iterative processes capable to freely foster a better future for individuals and society**
- **The presentation develops the first of these five theses : cognition allows to know the world, to explore and perceive, to model.**

18/11/2014

J.-D. Dessimoz, HESSO.HEIG-VD, SGAICO, Basel

4

## 2. Context 1 of 2

---

- **Overview of the five delineated theses about cognition:**
  - 1. cognition allows to know the world, to explore and perceive, to model;**
  - 2. cognition allows for defining alternative worlds and possible futures, visions, for anti-causality;**
  - 3. cognition allows for effective control;**
  - 4. cognitics allows for a large scale, technical deployment of cognition;**
  - 5. social cognitics can provide a foundation for team action and increased momentum for change.**

18/11/2014

J.-D. Dessimoz, HESSO.HEIG-VD, SGAICO, Basel

5

## 2. Context 2 of 2

---

•The presentation will develop the **first** of these theses: « Cognition is necessary to perceive, explore and model the world ».

**Therefore:**

- **first, cognition requires a better understanding**
- **then, making the underlying capability automated will boost its deployment**
- **Cognition features two very different components:**
  - **elements of immaterial nature**
  - **physical supporting infrastructure**
- **Modeling is necessary for the creation/replication of cognitive systems, as well as for their evolution**

7

## 3. Immaterial aspects 2 of 4

**In cognition, conceptual elements (re. blue box) are immaterial (non-physical), even when they relate to reality [4] .**

## 4. Physical support infrastructure 1

- **Information is carried by messages, and requires an implementation on physical supports ("signals").**
- **Cognition requires a physical infrastructure, an "engine", in order to yield pertinent output, as the latter information is usually not stored as such.**
- **For deployment in the real world, physical resources, such as energy or structural elements, are also required.**

*Schematic view of cognition. (a) Cognition and, effectively, cognitive systems generate information.*

*(b) Cognitive properties can be quantitatively estimated on the basis of the input-output information flows, and time.*

12

## 5. Innate and acquired capabilities 1

**In cognition, backtracking is the rule.**

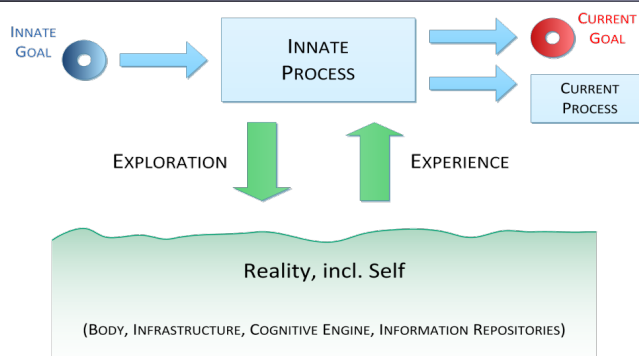

**From the selected goal, specifications are derived, which then lead the cognitive process, and in particular an active perception (“exploration”) faculty capable of acquiring the non-physical experience necessary for action and possibly later improvements.**

18/11/2014

J.-D. Dessimoz, HESSO.HEIG-VD, SGAICO, Basel

13

## 5. Innate and acquired capabilities 2

**Current goals and processes may result from exploration performed and/or experience acquired by an agent, running a given cognitive process in a certain domain of reality.**

**Initial goals and processes are innate (or “wired”).**

18/11/2014

15

## 6. The challenges of modeling <sup>1</sup>

---

- **The complexity of reality is infinite**
  - **How to acquire information? (the perception problem)**
    - **How to sense**
    - **How to explore**
  - **How to induce information processing schemes? (the cognition problem)**
- **Chance and dedication can help**
  - **truly novel solutions typically occur by chance**
  - **observations and experiments should be recorded**
  - **critical elements should be identified, possibly by replicating experiments with systematic variations of parameters**
  - **Re-use best known, proven solutions**

18/11/2014

J.-D. Dessimoz, HESSO.HEIG-VD, SGAICO, Basel

16

## 6. The challenges of modeling <sup>2</sup>

- **The complexity of models should be minimized**
- **Experts are said to be very good at ignoring non-critical parameters**
- **Trade truth and completeness (correspondance to reality) for wisdom (correspondance to goal) and effectiveness**

18/11/2014

J.-D. Dessimoz, HESSO.HEIG-VD, SGAICO, Basel

17

18

## 7. Conclusion

---

- Time as come for **cognitics**
- In cognition, **modeling** the world is the first challenge to address, starting with the **modeling process itself**
- The **cognitive** world is essentially non-physical, **immaterial**
- Cognition requires though a **physical support infrastructure**, as well as "engine" and for mediating input-output resources (sensors and actuators) wrt real world
- Some **initial** cognitive **capabilities** must be **innate/wired**. Possibly, new capabilities may be acquired.
- Some **hints** have been **given for** addressing the **main modeling challenges**:
  - for probing the **infinitely complex reality**,
  - for reducing goal-oriented processes to **tractable yet effective solutions**

18/11/2014
